Draft: January 4, 2024

ABSTRACT

Although writing more than a century ago, Franz Kafka captured the core problem of digital technologies – how individuals are rendered powerless and vulnerable. During the past fifty years, and especially in the 21st century, privacy laws have been sprouting up around the world. These laws are often based heavily on an Individual Control Model that aims to empower individuals with rights to help them control the collection, use, and disclosure of their data.

In this Essay, we argue that although Kafka starkly shows us the plight of the disempowered individual, his work also paradoxically suggests that empowering the individual isn't the answer to protecting privacy, especially in the age of artificial intelligence. In Kafka's world, characters readily submit to authority, even when they aren't forced and even when doing so leads to injury or death. The victims are blamed, and they even blame themselves.

Although Kafka's view of human nature is exaggerated for darkly comedic effect, it nevertheless captures many truths that privacy law must reckon with. Even if dark patterns and dirty manipulative practices are cleaned up, people will still make bad decisions about privacy. Despite warnings, people will embrace the technologies that hurt them. When given control over their data, people will give it right back. And when people's data is used in unexpected and harmful ways, people will often blame themselves.

Kafka's provides key insights for regulating privacy in the age of AI. The law can't empower individuals when it is the system that renders them powerless. Ultimately, privacy law's primary goal should not be to give individuals control over their data. Instead, the law should focus on ensuring a societal structure that brings the collection, use, and disclosure of personal data under control.

INTRODUCTION

At the turn of the 21st century, one of us noted that Franz Kafka's *The Trial* was a fitting metaphor for the privacy problems caused by the aggregation of personal data in large computer databases.³ *The Trial* opens with two officials informing the protagonist, Josef K., that he is under arrest. They don't tell him why–they actually don't know the reason—but they explain that a bizarre clandestine court system has a dossier about him and is making decisions about him. K. desperately—even obsessively—tries to find out more, but he barely learns anything. As one of us wrote, Kafka depicts a "thoughtless process of bureaucratic indifference, arbitrary errors, and dehumanization, a world where people feel powerless and vulnerable, without any meaningful form of participation in the collection and use of their information."⁴

We are now nearly a quarter of the way into the 21st century, and digital technologies have continued their relentless progression. Organizations are gathering vastly more personal data and are using it to influence and manipulate our behavior. Powerful machine learning algorithmic systems, colloquially known as "artificial intelligence" or "AI," are being used to make an ever-expanding range of decisions affecting our lives.

To address these problems, privacy laws have been enacted at a furious pace. By the early 2000s lawmakers began to realize the need for new surveillance and data protection rules. New laws have sprouted up around the world. The crown jewel of data privacy laws, the EU's General Data Protection Regulation (GDPR), was enacted in 2016. Privacy laws are popping up in the U.S. states like popcorn kernels in a sizzling frying pan.⁵

Most privacy laws have tried to address the problems that Kafka captured so vividly in his work – the devastating powerlessness of individuals. By and large, most privacy laws have adopted what we refer to as the "Individual Control Model," which seeks to empower individuals to control their data.

In this Essay, which serves as an introduction to a symposium on privacy law's past, present, and future, we argue that the Individual Control Model has not only failed, but it is doomed, especially in the age of AI. Intuitively, the Individual Control Model appears to address the problem of individual powerlessness so chillingly portrayed by Kafka. Was it wrong for the law to focus on this problem? We contend that although individual powerlessness is the right problem, the Individual Control Model is the wrong approach to address it.

Revisiting Kafka's work shows us why. A closer look at Kafka's depiction of the individual powerlessness problem reveals its full paradoxical nature. Although individuals are disempowered, the answer isn't to try to empower them with control over their data. In Kafka's fiction, characters readily submit to authority, even when they aren't forced and even when doing so leads to injury or death. The victims are blamed, and they even blame themselves. In its dark and dramatic way, Kafka's work teaches us that trying to give people control doesn't empower them, and it can even make the situation worse.

Drawing upon Kafka's view of human nature, we argue that the control privacy law gives to people is often turned against them and that people readily surrender any control they might be given. People eagerly embrace the technologies that hurt them or make choices to their detriment. Although the law should certainly stop organizations from exploiting and manipulating people, merely curtailing these practices isn't enough.

In contrast to the Individual Control Model, we contend that another model would be far more effective – the "Societal Structure Model." This model, which we and other academics have advanced in varying forms and names for many decades, has unfortunately been overlooked by policymakers in their futile quest to make the Individual Control Model work. Instead of trying to empower individuals to control their data, the Societal Structure Model focuses on controlling the power of organizations to collect, use, and disclose personal data and preventing harm to individuals and society.

In Part I we discuss the Individual Control Model and the Societal Structure Model. In Part II, we argue that Kafka's work provides provocative insights into why the Individual Control Model is doomed. In Part III, we contend that the rise of AI makes the futility of the Individual Control Model vividly apparent.

I. TWO MODELS FOR PRIVACY PROTECTION

During the latter half of the 20th century, where the current approach to privacy regulation was being forged, a clash arose between two differing visions of how privacy should be regulated – the Individual Control Model and the Societal Structure Model.

Although many academic commentators recommended the Societal Structure Model, policymakers embraced the Individual Control Model. As is becoming increasingly clear in today's age of AI, the Individual Control Model is the wrong choice.

A. THE INDIVIDUAL CONTROL MODEL

The Individual Control Model aims to empower individuals and give them control over their personal data.⁶ Professor Alan Westin, perhaps the most influential architect of this approach, proclaimed that privacy was "the claim of individuals, groups, or institutions to determine for themselves when, how, and to what extent information about them is communicated to others." The individual control model was embraced in the influential 1973 report by the U.S. Department of Health, Education, and Welfare (HEW), which proclaimed that individuals should have "a right to participate in deciding what the content of the record will be, and what disclosure and use will be made of the identifiable information in it."

Privacy and data protection laws sprouted up in the U.S., Europe, and around the world, and most embraced the Individual Control Model in significant part. These laws relied heavily on providing individual privacy rights so that people could manage their data. In U.S. laws, these rights generally included a right to information about data collected about a person, a right to access that data, and a right to correct errors or omissions in the data. European laws provided additional rights such as a right to delete (or erase) data from records, a right to object to the processing of data, a right to not be subject to automated decisions, and other rights.

In the U.S., many laws sought to implement the Individual Control Model through the notice-and-choice approach, where organizations posted notices about their privacy practices and individuals could opt out if they objected.

⁶ Charles Fried, *Privacy*, 77 Yale L.J. 475, 482 (1968) ("Privacy is not simply an absence of information about us in the minds of others; rather it is the control we have over information about ourselves."); Jerry Kang, *Information Privacy in Cyberspace Transactions*, 50 Stan. L. Rev. 1193, 1218 (1998) ("[C]ontrol is at the heart of information privacy."); Michael Birnhack, *A Quest for a Theory of Privacy: Context and Control*, 51(4) Jurimetrics 447-479 (2011); Michael Birnhack, *In Defense of Privacy-As-Control (Properly Understood)*, work in progress (on file with authors).

⁹ Solove, Limitations of Privacy Rights, 98 Notre Dame L. Rev. 975 (2023).

Of course, people don't read privacy notices and have no clue what is being done with their data. Nobody really took notice-and-choice seriously; it has been thoroughly and continually skewered by commentators.¹⁰

Another hallmark of the Individual Control model involves consent requirements.¹¹ In the EU's data protection approach, consent must be express and affirmative (opt in). Although express consent is far superior to the notice-and-choice approach, it still depends heavily on the ability of individuals to make meaningful decisions about the collection and use of their data. No matter whether consent requirements are strict or lax, opt in or opt out, consent is, at its core, about individual control.

B. THE SOCIETAL STRUCTURE MODEL

In contrast to the Individual Control Model, leading scholars have long advocated for the Societal Structure Model. This view begins with the recognition that privacy is not purely (or even primarily) an individual interest; instead, privacy should be protected for the purpose of promoting societal values such as democracy, freedom, creativity, health, and intellectual and emotional flourishing. Many scholars, especially Paul Schwartz, Oscar Gandy, Julie Cohen, Joel Reidenberg, Spiros Simitis, and Priscilla Regan, have long pointed out the importance of viewing privacy as a societal value, not just an individual interest. Under this view, privacy is first and foremost about power and how human information is relevant in its creation, deployment, and distribution.

We both joined the societal structure party in the early 21st Century. As Solove contended, "the protection of privacy depends upon an architecture that structures power, a regulatory framework that governs how information is disseminated, collected, and networked. We need to focus on controlling power." Hartzog rejected the Individual Control Model as illusory, overwhelming, and myopic, advocating for design rules and a better

structural allocation of power instead.14

As the 21st century unfolded, many scholars joined in to advocate for the Societal Structure Model.¹⁵ We and many others have fleshed out the contours of structural approaches for protecting trust within information relationships,¹⁶ for a relational approach to data governance,¹⁷ for the natural obscurity that people create and rely upon for their everyday lives,¹⁸ for the contextual integrity of personal information flows,¹⁹ for privacy as a public good,²⁰ and for nonwaivable privacy entitlements,²¹ among other concepts that extend beyond notions of individual control.

As Julie Cohen has expressed so aptly, "privacy incursions harm individuals, but not only individuals. Privacy incursions in the name of progress,

innovation, and ordered liberty jeopardize the continuing vitality of the political and intellectual culture that we say we value. A structural understanding of privacy's importance demands a structural approach to privacy regulation."²²

C. THE DOMINANCE OF THE INDIVIDUAL CONTROL MODEL

Ultimately, the commentators advocating for the Societal Structure Model did not convince lawmakers and ended up writing in dissent of existing and proposed privacy laws. Policymakers powered forward with the goal of arming individuals with rights.

In 2016, the EU enacted the General Data Protection Regulation (GDPR), a grand milestone for privacy. The GDPR, however, still has informational self-determination as its beating heart. Although it has many provisions that draw from the Societal Structure Model (requirements to justify data processing, minimize data collection and use, data protection impact assessments, data protection by design and default, vendor management, etc.), the GDPR still rests heavily on individual control. The GDPR allows a wide range of data processing with consent.²³ GDPR data protection also depends significantly on individual rights, which occupy a substantial amount of internal organizational compliance efforts and external enforcement.²⁴

For automated decision-making, the GDPR's protections rely prominently on giving individuals a right to have a human involved,²⁵ even though in many contexts it remains unlikely that humans in the loop will improve the decisions.²⁶ Talia Gillis and Josh Simons aptly critique the GDPR's approach for resting too much on individual control: "Institutions should justify their choices about the design and integration of machine learning models not to individuals, but to empowered regulators and other forms of public oversight bodies."²⁷

As Margot Kaminski notes, the GDPR, to its credit, "attempts to provide backstops beyond individual control." But these structural elements are not strong enough; too much of the GDPR rests on individual control. Many of these structural elements are rather barebones measures that lack

sufficient accountability or scrupulousness. As Ari Waldman contends, compliance measures can become hollow performative paper-pushing exercises.²⁹ Many of the GDPR's structural elements lack the same muscle and rigor as the GDPR's individual control elements. For example, requirements to engage in data protection by design and default and to perform privacy impact assessments lack much specificity or accountability, allowing companies to do them in minimalistic and perfunctory ways.³⁰ And beyond the GDPR, privacy laws around the world rely much more heavily on individual control, especially via individual consent.³¹

Despite being partially influenced by the GDPR, recent U.S. state consumer privacy laws are firmly founded upon the Individual Control Model. Within months of the GDPR going into effect in 2018, California enacted the California Consumer Privacy Act (CCPA). In the ensuing years, many other states followed suit, enacting similar laws. These laws, however, are still largely layered on the bones of the notice-and-choice model, with a few structural pieces from the GDPR sprinkled in. The laws have ventured a bit beyond Individual Control Model, but not far enough. For example, the CCPA's regulations have echoed some of the structural provisions of the GDPR, but still focus on people's expectations and choices. While the GDPR at least has a notable footing in the Societal Structure Model, the other U.S. state consumer privacy laws have only a toe in it.

Policymakers keep passing privacy laws at a fever pitch, but most of them still cling to the Individual Control Model. There are a few recent exceptions where lawmakers have embraced the Societal Structure Model, such as the European Union's AI Act and the Digital Services Act, which work primarily through substantive rules and duties aimed at limiting risk and harm regardless of an individual's consent or control. But for the most part, privacy law could have been much better prepared for the risks of AI had it been built upon the Societal Structure Model rather than the Individual Control Model.

II. KAFKA AND THE FUTILE QUEST TO EMPOWER INDIVIDUALS

Kafka's works provide vexing and dismaying reasons why the Individual Control Model is doomed. The impetus for the individual control model stems from how radically people are disempowered when their data is being collected, used, and transferred. Kafka's writings adeptly capture people's harrowing helplessness and vulnerability when at the mercy of powerful and opaque entities that have dossiers about them and that make important decisions about their lives. Individuals are at the mercy of impersonal and uncaring bureaucratic processes; people's fates are decided in standardized ways that ignore the whole story and human texture of their lives.

On the surface, the goal of individual control makes sense; people are being disempowered, so the law should try to combat disempowerment with empowerment. If privacy losses are interferences with autonomy, then more control seems like a sensible answer. As privacy problems have grown more dire, policymakers have reacted by giving individuals more rights, more notice, more choices, and more self-management. But as Kafka's work demonstrates, this strategy will fail to meaningfully protect the vulnerable from the powerful.

A. KAFKA'S DARK PORTRAIT OF HUMAN NATURE

Throughout his work, Kafka paints a dark portrait of human nature. He vividly captures the plight of the weary individual. Officials are whipped for failures they can't control; people are put on trial without being told what they did wrong; a man wakes up transformed into a monstrous insect and is treated with disdain; and countless other people face absurd, unjust, and humiliating circumstances. There are no happy endings; people are never able to extricate themselves from their situations. With Kafka, things start out badly, then they grow worse.

Turning to modern digital technologies, individual control is often an illusion. People don't exercise control in a meaningful way. Merely being in a command center with various switches, buttons, and levers is mere theater unless people have the ability and knowledge to operate the controls. The individual's ability to exercise control always exists within a larger power structure.

One hope with privacy law is that it can protect people by stopping organizations from coercing, manipulating, and exploiting them. Many privacy laws aim to ensure that organizations are more transparent about data collection and use, to stop dark patterns and other manipulative practices, and to require organizations to give people choices to opt in, opt out, or delete their data.

These protections are good, but Kafka's work teaches us that these measures are far from enough. The most challenging and deeply disturbing dimension

to Kafka's depiction of human nature is that people are often not passive victims; they willingly participate in their peril. They rush toward it and embrace it. In some cases, they even crave it. Surveillance isn't just hoisted upon people; many people eagerly sign up for it.32 People embrace and normalize the fruits of the digital age, no matter how poisonous they might be.³³ People will often make choices that are not in their own best interest.

In her incisive takedown of Richard Posner's law and economics work, Robin West compares Kafka's vision of human nature to Posner's "simplistic and false psychological theory of human motivation."34 Posner's view of human nature is that people enter into transactions "for only one reason - to maximize their own welfare."35 West argues: "Whereas Posner's characters relentlessly pursue autonomy and personal well-being, Kafka's characters just as relentlessly desire, need, and ultimately seek out authority."36 She notes that Kafka's characters consent to being controlled. People don't calculate all of the time" – they often "simply obey, acquiesce, or submit." **37

Kafka's depiction of human nature serves not only as a counterpoint to Posner but also to the Individual Control Model. Kafka shows us that it is profoundly difficult to empower people, not just because the forces arrayed against them are overpowering, but also because people willingly surrender to those forces. For example, in "The Judgment," when a despicable father chastises his son and tells him to drown himself, the son willingly carries out his father's sentence.³⁸ In the parable, "Before the Law," which is a part of Kafka's *The Trial*, a man arrives at the gates to the Law and wants to enter, but a doorkeeper recommends that he not do so. Although the doorkeeper does nothing to stop the man from proceeding, the man "decides he would prefer to wait until he receives permission to enter." He waits for years and years, constantly begging to be admitted. Then he dies.³⁹ And more broadly in The Trial, Josef K. believes in the legitimacy of the court system despite countless signs it is illegitimate - the offices are in attics in rundown buildings; court proceedings are held in decrepit living rooms; what appear to be law books are not. At every turn, the system is unprofessional and even ramshackle. Yet, Josef K. accepts its authority and willingly submits to its power — even his own execution.⁴⁰ In each piece, people acquiesce to authority without being forced to do so.

Kafka's works defy simple explanations as to why people make these ruinous

decisions to submit. Kafka invites us to contemplate the bewildering complexity and absurdity of human psychology with all its restless emotions, sudden impulses, inexplicable irrationality, contradictory dimensions, and subconscious forces. Kafka shows us that we must reckon with this side of human nature.

As with Kafka's characters, in the real world, people frequently make detrimental and submissive privacy decisions. People often trust companies without much basis (and sometimes contrary to the previous actions by these entities). People readily click the "accept" button or share their data without even trying to exercise their choices. For the most part, people just follow along and do what companies want them to do.

In Kafka's writings, people repeatedly take actions that are not only against their own self-interest but also harmful and destructive to themselves. In "The Hunger Artist," the protagonist sits in a cage at a carnival and starves himself to death, not because he wants to entertain the public but because he can't find any food that will satisfy him.⁴¹ Compare this to the paradox of choice that confounds everyone confronted with an overwhelming number of options to control their data, none of which quite fit people's preferences or the real risk of exposure.⁴²

Giving people more control won't save Kafka's characters. They aren't compelled into their fates; they often actively participate in their own demise. For privacy, the same phenomena are occurring. People readily "consent" to the widespread indiscriminate collection and use of their data.⁴³ Sometimes this is because companies exploit and trick people into submitting. But many times, companies can just nudge, tempt, or seduce people into the behaviors that generate profit, which often involve people maximally exposing their data.⁴⁴ Kafka's stories provide the lesson that people might still be disempowered even when companies aren't acting maliciously. When given power, people often will give it right back. If people are given opt in rights, companies will lure people to opt in. If people are given property rights in their data, companies will entice them to trade it for trinkets.

The behavior of Kafka's characters might be a comic exaggeration, but Kafka captures many disturbing truths about human nature, which is why his works have endured and still resonates with readers today. Stanley Milgram's studies have shown that people readily submit to authority.⁴⁵

⁴⁵ STANLEY MILGRAM, OBEDIENCE TO AUTHORITY; AN EXPERIMENTAL VIEW (1974).

People can develop harmful technological dependencies.⁴⁶ People often act against their own self-interests, sometimes in highly self-destructive ways. 47 Not only do people fail to act rationally, but they also act in absurdly unproductive ways.

These dimensions of human nature demonstrate that merely giving people options will not be enough. Nor will it be sufficient to merely hand people power, as they might give it right back.

The Individual Control Model assumes that if people are given the tools to manage their privacy, they will effectively do so, or in the least have a meaningful opportunity to try. But the task of privacy self-management is an impossible one – people can't exercise their privacy rights at scale; nor can people learn enough to effectively determine the risks when sharing their data or make appropriate cost-benefit decisions.⁴⁸ Kafka also shows us that even if privacy self-management were somehow possible at scale, many people might not behave as the Individual Control Model envisions. Instead, if bestowed with control over their data, people will willingly cede it to the large entities that are collecting and using their data. And they will do so even when it harms them.

B. BLAMING THE VICTIMS, BLAMING OURSELVES

Kafka's characters internalize the absurd, arbitrary, and unfair forces against them. They feel guilty and fault themselves for being victims. Kafka doesn't explain why people behave in this way; his works starkly illuminate these peculiar phenomena and invite us to ponder why.

In the context of data privacy, people behave in similar ways to Kafka's characters, oddly internalizing the blame when their data is misused. In a study, Yafit Lev-Aretz and Aileen Nielsen found that people often blame themselves their data is used in unexpected and undesired ways.⁴⁹ They note that people "feel guilty as if they were in fact powerful, knowledgeable, and fully morally culpable when making privacy choices even though a broad spectrum of scholarship shows they are not and cannot be."50 In Kafkaesque form, people turned inward, faulting themselves. Of course, the system is at fault – it sets people up with the impossible and burdensome task of privacy self-management where failure is a foregone conclusion.51

This is the situation many organizations desire – it shifts the blame to the victims. Companies can merrily go on doing whatever they please; policymakers can pat themselves on the back for giving consumers rights; and when people fail to use these rights, they can be blamed for not caring enough about their privacy. In what has become known as the "Privacy Paradox," people say they value privacy yet fail to take steps to protect it.⁵² Commentators then proclaim that people's behavior indicates they don't really care about privacy. For example, Law professor Omri Ben-Shahar concludes that people barely value privacy protections and are "nonchalant with respect to aggressive collection of their personal information."⁵³

In the related context of data security, we have noted that people are routinely expected to perform security best practices despite lacking the capacity to do.⁵⁴ They must memorize long and complex unique passwords for hundreds (sometimes thousands) of accounts; they must become experts in spotting phishing attempts and spoofed emails and websites. People are destined to fail, and when they do, they are chastised for being foolish for choosing bad passwords or falling for phishing tricks.

Instead of empowering people, the law provides the illusion of empowerment while actually further disempowering people, throwing them into a Kafka story of blame, guilt, and impossible endless tasks. The very laws aimed at protecting us are—in perhaps a most fitting Kafkaesque irony—worsening our plight and its utter absurdity.

C. SURRENDERING TO THE MACHINES: THE TECHNOLOGY TRAP

Kafka's story, "In the Penal Colony," captures our relationship to technology in a shocking and thought-provoking way that has further lessons for privacy law. An officer at a penal colony proudly shows off his elaborate torture and execution machine to an explorer.⁵⁵ To the explorer's surprise, the officer suddenly strips off his clothes and climbs into the machine. The machine's gears start turning, beginning the process of etching words on his body with its needles. But the machine malfunctions, turning the demonstration into a horrific and bloody nightmare.

Just as the officer willingly tries out his own machine, despite the lethal consequences, people are drawn to dangerous technologies. People embrace technology even when it will harm them.⁵⁶ Companies offer a cornucopia of exciting and addictive new technologies, from smart phones to home

assistant devices to smart doorbells to security cameras to gaming consoles to AI tools to social media and more. When people embrace these dazzling creations which are designed to extract their data as the price, they are blamed for not caring about their privacy.

People use these technologies despite concerns and even dire warnings, despite blinking red lights and blaring alarms. They install them into their homes, carry them around in their pockets, strap them to their wrists and heads, and put them into their bodies. They eagerly plug themselves into the matrix. They are told that the cost for all this must be their privacy, even though nothing makes this tradeoff inevitable. In fact, all the while, people lament the loss of privacy and overwhelmingly say they want privacy, but they still use privacy-invasive technologies. The law's answer: More transparency. If we just tell people what will be done with their data, if people were better informed, then they would be able to resist all the scrumptious entrees at the technology buffet. Tech evangelists like Nir Eyal advocate that we just reclaim personal responsibility and teach ourselves to resist these temptations.⁵⁷ But Kafka shows us that often no amount of education will change people's course. People will still eat the food even if they know it is laced with poison. The food is simply too delicious.

If Kafka were writing about AI, he'd likely not use the typical science fiction plot of robots suddenly desiring to rule us or exterminate us. For Kafka, we'd willingly submit to the robots and beg them to rule us.

⁵⁷ See Nellie Bowles, Addicted to Screens? That's Really a You Problem, New York Times (Oct. 6, 2019) ("Mr. Eyal does not think tech is the problem. We are. "We talk about addiction, but when it comes to Candy Crush, really? Facebook? We're not freebasing Facebook. We're not injecting Instagram here," Mr. Eyal said one morning over croissants at New York's Bryant Park. "These are things we can do something about, but we love to think the technology is doing it to us." And so in "Indistractable,"...Mr. Eyal has written a guide to free people from an addiction he argues they never had in the first place. It was all just sloughing off personal responsibility, he figures. So the solution is to reclaim responsibility in myriad small ways.").

III. PRIVACY, AI, AND SOCIETY

We are now several decades into the 21st Century, and AI is the rage. But AI is hardly new; in fact, it's quite old. The term "artificial intelligence" was coined by John McCarthy back in 1955 at Dartmouth.⁵⁸ Despite decades of ensuing development and enthusiasm, the results were disappointing.⁵⁹ We never saw the rise of robots that could think as science fiction had envisioned. (The idea that machines can ever "think" like humans is a dangerous narrative that distracts the discourse about the risks of AI). What we call "artificial intelligence" today is just the product of a very effective rebrand of algorithms and data in automated systems that can calculate inferences based on patterns in massive quantities of data. As Chris Wiggins and Matthew Jones aptly observe, "Machine learning, especially machine learning using neural nets, was rebranded as AI by corporate consultants and marketers, sometimes to the discomfort of researchers."

The concepts and concerns with today's AI have been quite similar throughout the years. Commentators in the 1960s and 1970s foresaw how computers would transform the collection of personal data and the way decisions would be made about people. They spoke in terms of "data banks." These concerns grew in the 1980s and 1990s. The rise of the commercial Internet in the late 1990s sparked grave concerns about massive databases about individuals. The term "data banks" had morphed into "databases." One of us called the analysis of data to make inferences about people the "aggregation effect." The term "data mining" became in vogue in the early 21st Century, followed by the uber-popular term "Big Data" to capture large-scale data gathering and analytics. Recently, terms such as "algorithms" and "inferences" are being used with greater frequency, along with the flashier term "artificial intelligence," which is used for nearly everything involving algorithms today. But the word "intelligence" is a misnomer – there is still nothing intelligent about artificial intelligence.

The rebrand to AI, though, has been quite effective in finally bringing many policymakers and others to realize the shortcomings of the Individual Control Model. AI appears to be endlessly complicated, opaque, inexplicable, and frightening. AI output is produced by determining patterns in massive quantities of data about millions of people. Because decisions based on AI about a person are made based upon data about other people, providing individuals with control over their own data is plainly inapposite. As Alicia Solow-Niederman notes, this type of algorithmic decision "disempowers

individuals about whom inferences are made, yet who have no control over the data sources from which the inferential model is generated."⁶³ Similarly, Salomé Viljoen argues that privacy law's focus on "individualist claims subject to individualist remedies . . . are structurally incapable of representing the interests and effects of data production's population-level aims."⁶⁴ The fictions justifying the Individual Control Model have trouble creating any plausible account of how the model is to work for modern AI technologies.

Policymakers finally appear to be losing hope that individuals are able to exercise control over these powerful and bewildering systems. They are enacting and proposing new laws to address AI that go far beyond the Individual Control Model and that are much more aligned with the Societal Structure Model.⁶⁵ The new EU AI Act is a milestone in this direction. Instead of relying heavily on individual rights, the law sets forth a risk-based approach that provides protection without placing the onus on individuals.⁶⁶ Certain deployments of AI are heavily restricted or outright prohibited. We are encouraged by this style of regulation, which will hopefully harbinger a new direction for AI.

New AI regulation is an important step forward, but existing privacy law must also be reworked to focus more on the Societal Structure Model. AI overlaps with privacy significantly, but there are still many AI issues that don't involve privacy, and vice versa. There are a myriad of instances of data collection, use, and disclosure beyond AI where individual control is inadequate as a regulatory response. We thus caution against AI exceptionalism; the Societal Structure Model should be embraced broadly for privacy regulation whether AI is involved or not.

Both of us have long argued for many steps privacy law can take to embrace the Societal Structure Model. For example, we have contended that the law should draw from the law of fiduciaries to impose duties on large organizations that collect and use our data.⁶⁷ These organizations should be

understood as *trusted parties* or *information fiduciaries*. One of the most important aspects of a fiduciary and trust approach to information privacy is the idea that the powerful companies that invite people's trust should be prohibited from acting in ways that conflict with trusting parties' best interests. This is not a novel legal approach. It's how the law deals with lopsided relationships where one party has all the power and information and the other is made vulnerable because of it.

The ultimate story is power. Digital technology is changing the dynamic of power in ways that threaten individuals. But Kafka shows us that empowering individuals is agonizingly complicated. Kafka's darkly comedic view of human nature is brutally candid and peers unblinkingly into the shadows of the human psyche.

In the end, if we reap one key insight from Kafka's work for how to regulate privacy in the age of AI, it is this: *The law won't succeed in giving individuals control; instead, the law must try to control the larger forces that exploit people and to protect individuals, communities, and society-at-large from harm.*

IV. CONCLUSION

Writing more than a century ago, Franz Kafka couldn't have been a more fitting prophet for our times today. If we accept Kafka's worldview, however, how do we avoid falling into despair? Is there a way out?

In "A Little Fable," Franz Kafka writes of a mouse who keeps running from one room to the next. The mouse says that "the whole world is growing smaller every day. At the beginning it was so big that I was afraid." The mouse keeps running and now notes that "these long walls have narrowed so quickly that I am in the last chamber already, and there in the corner stands the trap that I must run into." The last line of the parable follows quite suddenly and abruptly: "You only need to change your direction,' said the cat, and ate it up." 68

Today, technology titans are racing to develop new technologies that are gathering and analyzing massive quantities of data about us. Despite the enactment of privacy laws around the world, we're still heading towards a trap.

The Individual Control Model is a dead end. Although many policymakers and commentators know this, they keep returning to it. It's the classic Kafka plot: People know that their quest is doomed and yet persist with it anyway.

In Kafka's world, the mouse doesn't change direction, and it meets an untimely demise. Let's hope in our world policymakers won't keep making the same mistake.
